Abstract: We here report an efficient microwave-assisted protocol for the synthesis of new aryliminothiazolylidene-2-thiazolidin-4-ones 6 and their azarhodacyanines derivatives 7 with quantitative yield from 2’-(methylthio)-4’-oxo-3H,4’H-[2,5-bithiazolylidene]-3’-ium tosylates 5 and 2-arylimino-5-(thiazol-2(3H)-ylidene)thiazolidin-4-ones 6, respectively, using as starting material the 4-thiazoline-2-thiones 1 and 3-methyl-2-thioxo-1,3-thiazolidin-4-one 3. The transformation of the tosylate salts 5 into their arylimino derivatives 6 has not been reported to date.

Keywords: Aryliminothiazolylidene-2-thiazolidin-4-ones; Azarhodacyanines; Microwave irradiation; DLC.

Introduction

It is well known that thiazole and fused heterocyclic thiazoles derivatives are found to be associated with various biological activities such as antibacterial, antifungal and anti-inflammatory activities\textsuperscript{1-4}. The 4-thiazolidinone derivatives have played an important role in medicinal chemistry. Moreover, the importance of the research carried out is due to their broad spectrum of biological activity, such as anti-HIV\textsuperscript{5,6}, antitubercular\textsuperscript{7}, antiproliferative\textsuperscript{8}, antimicrobial\textsuperscript{9,10}, anti-inflammatory\textsuperscript{11,12}, anticancer\textsuperscript{13}, and antifungal\textsuperscript{14}.

2-Heteroarylimino-1,3-thiazolidin-4-ones in particular thiazolimino- and benzothiazol imino-types, have been described in the literature and used as scaffolds for preparing a range antibacterial and antifungal compounds\textsuperscript{15-17}, however, derivatives bearing a bis(thiazol-2(3H)-ylidene moiety as ring have not yet been known.

On the other hand, it has been reported in the literature that rhodacyanine dyes, designed by using the DLC (\(\pi\)-delocalized lipophilic cation) hypothesis\textsuperscript{18}, exhibit potent in \textit{vitro} antimalarial activity against \textit{Plasmodium falciparum} and antitumor activity\textsuperscript{19,20}.

Furthermore, the azarhodacyanines may be considered analogous to the rhodacyanine dyes and have been previously synthesized and designed as second generation of antimalarial rhodacyanines. Thus, these azarhodacyanines were obtained by condensation of 3-ethyl-5-(1-methylquinolin-2-ylidene)-2-(3-methylthio)-4-oxathiazolium P-toluenesulfonate with 2-minomethylpyridinium salt in the presence of triethylamine, in refluxing acetonitrile for 12h in 71% yield \(^{21}\) (Scheme 1).

**Scheme 1.** 1-Methyl-2-{[3-ethyl-5-(1-methylquinolin-2(1H)-ylidene)-4-oxothiazolidin-2-(pyridin-2-ylimino)methyl]pyridinium chloride (azarhodacyanine)

In view of the biological importance and in continuation of our previous work in which we have studied the beneficial effect of microwave irradiation on the condensation reaction for the synthesis rhodacyanines analogues\(^{22}\), we report herein an efficient microwave-assisted protocol for the synthesis of new aryliminothiazolylidene-2-thiazolidin-4-ones (6) from 2'-(methylthio)-4'-oxo-3H,4'H-[2,5-bithiazolylidene]-3'-ium tosylates (5). This method was developed previously in our laboratory\(^{22}\) and used the condensation of the starting material with aromatic amines in the presence of triethylamine.

In this paper, 4-thiazoline-2-thione (1)\(^{23}\) as starting material was transformed into aryliminothiazolylidene-2-thiazolidin-4-ones (6) which have not been reported to date. Hence, it is through of interest to accommodate 2-heteroarylimino-1,3-thiazolidin-4-ones and thiazole moieties in a single molecular framework and screen for their biologically activities.

The azarhodacyanines (7a,f) were obtained by simple quaternization from the corresponding aryliminothiazolylidene-2-thiazolidin-4-ones (6j,l).

**Results and Discussion**

Initially, a synthesis of 4-thiazoline-2-thione 1\(^{23-26}\) by Hantzsch’s cyclization is used for preparing the aryliminothiazolylidene-2-thiazolidin-4-ones 6 under microwave conditions (scheme 1). Two types of heating, conventional and the microwave activation were used.

The reaction under microwave was run at a frequency of 2.45 GHz with continuous irradiation power from 0 to 300W. The reaction temperature in the microwave cavity was measured with an IR captor (infrared thermometry) and the software algorithm regulates the microwave out-put power so that the preselected maximum temperature is maintained for the desired reaction/irradiation time. Synthesis of 6 was accomplished by a four-step sequence from 4-thiazoline-2-thiones 1. S-methylation of 1 gave access to thiazolium salt 2 which was transformed into 5-(thiazol-2(3H)-ylidene)-2-thioxothiazolidin-4-ones 4 by condensation with N-methylrhodanine 3 in the presence of triethylamine. Activation by $S$-methylation of 4 furnished salt 5\(^{22}\) (Scheme 2).

* Isolated yield

The results summarized in table 1 and 2 show that in microwave-assisted synthesis conditions, the yields of the new compounds 6 and 7 were better than conventional methods. The difference in reaction time between these two condensation conditions methods procedure was evident.

The structural elucidation of compounds (6 and 7) is based on spectroscopic data (¹H and ¹³C NMR) and mass spectrometry HRMS. The attribution for (2Z, 5E)-stereochemistry of compounds (6 and 7) was based on the literature data¹⁹,²⁷.

The ¹H NMR of compounds (6 and 7) exhibit a typical signal for the H-5 proton of the thiazolic ring around 5.98-6.63 ppm for (6) and 6.45-6.85 ppm for (7), while the ¹H NMR spectra of 6 showed N-CH₃ as a singlet at 3.53-4.10 ppm. The ¹³C NMR spectra of (6 and 7) were characterized by the presence of C-2 rhodanine C=N at 153.5-159.7 ppm for (6) and 157.6-160.1 ppm for (7); and C=O the C-4 rhodanine at 163.2-166.6 ppm for (6) and 162.8-163.2 ppm for (7).
Conclusion

The microwave-assisted condensation reaction of \(2'\)-(methylthio)-4'-oxo-3\(H\),4\(H\)-[2,5-bithiazolylidene]-3'-ium tosylates (5a,c) with aromatic amines, is a technique which gives satisfactory experimental results, affording good to high yields of new aryliminothiazolylidene-2-thiazolidin-4-ones (6a,l) and their azarhodacyanines derivatives (7a,f), in significantly shorter reaction times compared to classical conditions. Up to now, this new approach has never been reported and may be a complement to those existing in the literature. This class of compound will be soon tested for biological activities.

Experimental Section

Melting points were determined on a Kofler apparatus. \(^1\)H NMR spectra were recorded on Bruker ARX 200 (200 MHz), Bruker 250 MHz and Bruker AC 300P (300 MHz) spectrometers and \(^{13}\)C NMR spectra on Bruker AC 300P (75 MHz) spectrometer in CDCl\(_3\) or DMSO-d\(_6\). Chemical shifts are expressed in parts per million downfield from tetramethylsilane as an internal standard. The mass spectra (MS) on a VARIANT MAT 311 at a ionizing potential of 70 eV in the Centre de Mesures Physiques de l’Ouest (CRMPO, Rennes). Reactions under microwave were performed in a PROLABO Synthewave\(^{\text{R}}\) 402 (2.45 GHz) microwave reactor with a single focused system. All solvents and reagents were purchased from Acros Organics and Aldrich Chemic and used without further purification unless otherwise stated.

Preparation of the compounds 1, 2, 3,4 and 5

Compounds (1a,c)

The preparation of the compounds 1 was obtained according to the literature\(^{22,26}\) from disulfide carbon, amine in aqueous ammonia, and chloroacetone by Hantzsch’s cyclization.

3,4-Dimethyl-1,3-thiazole-2(3\(H\))-thione (1a).

II-General procedure for the preparation of arylinothiazylylidene-2-thiazolidin-2-ones (6a,l)

(a) Classical heating: Method A

To a solution of the appropriate amines (2.5 mmol) in 20mL of anhydrous acetonitrile, the salts tosylates 5 (3mmol) and triethylamine (0.4mL, 3mmol, 0.30g) were added and reaction mixture was refluxed for 4-8h. Evaporation of the solvent was followed by purification of the residue by recrystallization from ethanol.

(b) Microwave-irradiation (MW): Method B

In an open cylinder quartz reactor (ф = 1.5cm) are placed (1.8 mmol) the appropriate salt 5, aromatic amine (1.5 mmol), acetonitrile (2mL) and triethylamine (0.20 mL, 0.152g, 1.5 mmol). The stirred mixture was irradiated at 90°C (90W, Synthewave® 402) with an appropriate reaction time from 8 to 12min. The crude reaction mixture was cooled at room temperature; the residue was recrystallized from ethanol.

**IV-General Procedure for the preparation of azarhodacyanines (7a,f) by quaternization of (6j,l)**

(a) **Classical heating: Method C**

In a 250 mL round bottom flask are placed 1 mmol of (6j,l), 7 mmol of MPTS (methyl p-toluenesulfonate) or 10 mmol of MeI. 20 mL of acetonitrile. The reaction mixture was refluxed during 6-8 h. After cooling to room temperature and solvent evaporation, the residue was washed with acetone.

(b) **Microwave-irradiation: Method D**

In an open quartz reactor are added 1 mmol of imine (6j,l), 7 mmol of MPTS (methyl p-toluenesulfonate) or 10 mmol of MeI. The mixture was exposed to microwave at 120°C (90 W, Synthewave(R), 402), for MPTS or 60°C (90 W, Synthewave(R), 402) for MeI during 10-15 min. The residue was washed with acetone.
